Critical Vulnerabilities Detail

70728 Apache PHPCGI Remote Code Execution

Synopsis

The remote web server contains a version of PHP that allows arbitrary code execution.

Description

The PHP installation on the remote web server contains a flaw that could allow a remote attacker to pass commandline arguments as part of a query string to the PHPCGI program. This could be abused to execute arbitrary code, reveal PHP source code, cause a system crash, etc.

Solution

Upgrade to PHP 5.3.13 / 5.4.3 or later.

Risk Factor

High

CVSS v3.0 Base Score

51988 Bind Shell Backdoor Detection

Synopsis

The remote host may have been compromised.

Description

A shell is listening on the remote port without any authentication being required. An attacker may use it by connecting to the remote port and sending commands directly.

Solution

Verify if the remote host has been compromised, and reinstall the system if necessary.

32314 Debian OpenSSH/OpenSSL Package Random Number Generator Weakness

Synopsis

The remote SSH host keys are weak.

Description

The remote SSH host key has been generated on a Debian or Ubuntu system which contains a bug in the random number generator of its OpenSSL library. The problem is due to a Debian packager removing nearly all sources of entropy in the remote version of OpenSSL. An attacker can easily obtain the private part of the remote key and use this to set up decipher the remote session or set up a man in the middle attack.

See Also

<http://www.nessus.org/u?107f9bdc>

<http://www.nessus.org/u?f14f4224>

Solution

Consider all cryptographic material generated on the remote host to be guessable. In particular, all SSH, SSL and OpenVPN key material should be regenerated.

32321 Debian OpenSSH/OpenSSL Package Random Number Generator Weakness (SSL check)

Synopsis

The remote SSL certificate uses a weak key.

Description

The remote x509 certificate on the remote SSL server has been generated on a Debian or Ubuntu system which contains a bug in the random number generator of its OpenSSL library. The problem is due to a Debian packager removing nearly all sources of entropy in the remote version of OpenSSL. An attacker can easily obtain the private part of the remote key and use this to decipher the remote session or set up a man in the middle attack.

11356 NFS Exported Share Information Disclosure

Synopsis

It is possible to access NFS shares on the remote host.

Description

At least one of the NFS shares exported by the remote server could be mounted by the scanning host. An attacker may be able to leverage this to read (and possibly write) files on remote host.

Solution

Configure NFS on the remote host so that only authorized hosts can mount its remote shares.

20007 SSL Version 2 and 3 Protocol Detection

Synopsis

The remote service encrypts traffic using a protocol with known weaknesses.

Description

The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including: An insecure padding scheme with CBC ciphers. Insecure session renegotiation and resumption schemes. An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients. Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). Therefore, it is recommended that these protocols be disabled entirely. NIST has determined that SSL 3.0 is no longer acceptable for secure communications. As of the date of enforcement found in PCI DSS v3.1, any version of SSL will not meet the PCI SSC's definition of 'strong cryptography'.

33850 Unix Operating System Unsupported Version Detection

Synopsis

The operating system running on the remote host is no longer supported.

Description

According to its selfreported version number, the Unix operating system running on the remote host is no longer supported. Lack of support implies that no new security patches for the product will be released by the vendor. As a result, it is likely to contain security vulnerabilities.

Solution

Upgrade to a version of the Unix operating system that is currently supported.

61708 VNC Server 'password' Password

Synopsis

A VNC server running on the remote host is secured with a weak password.

Description

The VNC server running on the remote host is secured with a weak password. Nessus was able to login using VNC authentication and a password of 'password'. A remote, unauthenticated attacker could exploit this to take control of the system.

Solution

Secure the VNC service with a strong password.

Risk Factor

Critical

125855 phpMyAdmin prior to 4.8.6 SQLi vulnerability (PMASA20193)

Synopsis

The remote web server hosts a PHP application that is affected by SQLi vulnerability.

Description

According to its selfreported version number, the phpMyAdmin application hosted on the remote web server is prior to 4.8.6. It is, therefore, affected by a SQL injection (SQLi) vulnerability that exists in designer feature of phpMyAdmin. An unauthenticated, remote attacker can exploit this to inject or manipulate SQL queries in the backend database, resulting in the disclosure or manipulation of arbitrary data. Note that Nessus has not attempted to exploit these issues but has instead relied only on the application's selfreported version number.

See Also

<http://www.nessus.org/u?c9d7fc8c>

Solution

Upgrade to phpMyAdmin version 4.8.6 or later. Alternatively, apply the patches referenced in the vendor advisories.

42424 CGI Generic SQL Injection (blind)

Synopsis

A CGI application hosted on the remote web server is potentially prone to SQL injection attack.

Description

By sending specially crafted parameters to one or more CGI scripts hosted on the remote web server, Nessus was able to get a very different response, which suggests that it may have been able to modify the behavior of the application and directly access the underlying database. An attacker may be able to exploit this issue to bypass authentication, read confidential data, modify the remote database, or even take control of the remote operating system. Note that this script is experimental and may be prone to false positives.

136769 ISC BIND Service Downgrade / Reflected DoS

Synopsis

The remote name server is affected by Service Downgrade / Reflected DoS vulnerabilities.

Description

According to its selfreported version, the instance of ISC BIND 9 running on the remote name server is affected by performance downgrade and Reflected DoS vulnerabilities. This is due to BIND DNS not sufficiently limiting the number fetches which may be performed while processing a referral response. An unauthenticated, remote attacker can exploit this to cause degrade the service of the recursive server or to use the affected server as a reflector in a reflection attack.

See Also

<https://kb.isc.org/docs/cve20208616>

Solution

Upgrade to the ISC BIND version referenced in the vendor advisory.

59088 PHP PHPCGI Query String Parameter Injection Arbitrary Code Execution

Synopsis

The remote web server contains a version of PHP that allows arbitrary code execution.

Description

The PHP installation on the remote web server contains a flaw that could allow a remote attacker to pass commandline arguments as part of a query string to the PHPCGI program. This could be abused to execute arbitrary code, reveal PHP source code, cause a system crash, etc.

See Also

<http://eindbazen.net/2012/05/phpcgiadvisorycve20121823/>

42873 SSL Medium Strength Cipher Suites Supported (SWEET32)

Synopsis

The remote service supports the use of medium strength SSL ciphers.

Description

The remote host supports the use of SSL ciphers that offer medium strength encryption. Nessus regards medium strength as any encryption that uses key lengths at least 64 bits and less than 112 bits, or else that uses the 3DES encryption suite. Note that it is considerably easier to circumvent medium strength encryption if the attacker is on the same physical network.

See Also

<https://www.openssl.org/blog/blog/2016/08/24/sweet32/>
<https://sweet32.info>

Solution

Reconfigure the affected application if possible to avoid use of medium strength ciphers.

90509 Samba Badlock Vulnerability

Synopsis

An SMB server running on the remote host is affected by the Badlock vulnerability.

Description

The version of Samba, a CIFS/SMB server for Linux and Unix, running on the remote host is affected by a flaw, known as Badlock, that exists in the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) protocols due to improper authentication level negotiation over Remote Procedure Call (RPC) channels. A maninthemiddle attacker who is able to intercept the traffic between a client and a server hosting a SAM database can exploit this flaw to force a downgrade of the authentication level, which allows the execution of arbitrary Samba network calls in the context of the intercepted user, such as viewing or modifying sensitive security data in the Active Directory (AD) database or disabling critical services.

See Also

<http://badlock.org>

<https://www.samba.org/samba/security/CVE20162118.html>

Solution

Upgrade to Samba version 4.2.11 / 4.3.8 / 4.4.2 or later.

36171 phpMyAdmin Setup Script Configuration Parameters Arbitrary PHP Code Injection (PMASA20094)

Synopsis

The remote web server contains a PHP application that is affected by a code execution vulnerability.

Description

The setup script included with the version of phpMyAdmin installed on the remote host does not properly sanitize usersupplied input before using it to generate a config file for the application. This version is affected by the following vulnerabilities : The setup script inserts the unsanitized verbose server name into a Cstyle comment during config file generation. An attacker can save arbitrary data to the generated config file by altering the value of the 'textconfig' parameter during a POST request to config.php. An unauthenticated, remote attacker can exploit these issues to execute arbitrary PHP code.

See Also

<https://www.tenable.com/security/research/tra200902>

http://www.phpmyadmin.net/home_page/security/PMASA20094.php

Solution

Upgrade to phpMyAdmin 3.1.3.2. Alternatively, apply the patches referenced in the project's advisory.

10205 rlogin Service Detection

Synopsis

The rlogin service is running on the remote host.

Description

The rlogin service is running on the remote host. This service is vulnerable since data is passed between the rlogin client and server in cleartext. A maninthemiddle attacker can exploit this to sniff logins and passwords. Also, it may allow poorly authenticated logins without passwords. If the host is vulnerable to TCP sequence number guessing (from any network) or IP spoofing (including ARP hijacking on a local network) then it may be possible to bypass authentication. Finally, rlogin is an easy way to turn filewrite access into full logins through the .rhosts or rhosts.equiv files.

Solution

Comment out the 'login' line in /etc/inetd.conf and restart the inetd process. Alternatively, disable this service and use SSH instead.

Risk Factor

Protocol	tcp
Synopsis	Some directories on the remote web server are browsable.
Description	Multiple Nessus plugins identified directories on the web server that are browsable.
Solution	Make sure that browsable directories do not leak confidential information or give access to sensitive resources. Additionally, use access restrictions or disable directory indexing for any that do.
Risk Factor	Medium
CVSS v2.0 Base Score	50

Name	HTTP TRACE / TRACK Methods Allowed
Plugin ID	44136
Port	80
Protocol	tcp
Synopsis	The remote web server is prone to cookie injection attacks.

Description	The remote web server hosts at least one CGI script that fails to adequately sanitize request strings with malicious JavaScript. By leveraging this issue, an attacker may be able to inject arbitrary cookies. Depending on the structure of the web application, it may be possible to launch a 'session fixation' attack using this mechanism. Please note that : - Nessus did not check if the session fixation attack is feasible. - This is not the only vector of session fixation.
Solution	Restrict access to the vulnerable application. Contact the vendor for a patch or upgrade.
Risk Factor	Medium
CVSS v2.0 Base Score	43

Name	HTTP TRACE / TRACK Methods Allowed

Protocol	tcp
Synopsis	The remote web server may be prone to HTML injections.
Description	The remote web server hosts CGI scripts that fail to adequately sanitize request strings with malicious JavaScript. By leveraging this issue, an attacker may be able to cause arbitrary HTML to be executed in a user's browser within the security context of the affected site. The remote web server may be vulnerable to IFRAME injections or cross-site scripting attacks : - IFRAME injections allow 'virtual defacement' that might scare or anger gullible users. Such injections are sometimes implemented for 'phishing' attacks. - XSS are extensively tested by four other scripts. - Some applications (e.g. web forums) authorize a subset of HTML without any ill effect. In this case, ignore this warning.
Solution	Either restrict access to the vulnerable application or contact the vendor for an update.

Synopsis	The remote name server is affected by a denial of service vulnerability.
Description	According to its self-reported version number, the installation of ISC BIND running on the remote name server is version 9.x prior to 9.11.22, 9.12.x prior to 9.16.6 or 9.17.x prior to 9.17.4. It is, therefore, affected by a denial of service (DoS) vulnerability due to an assertion failure when attempting to verify a truncated response to a TSIG-signed request. An authenticated, remote attacker can exploit this issue by sending a truncated response to a TSIG-signed request to trigger an assertion failure, causing the server to exit. Note that Nessus has not tested for this issue but has instead relied only on the application's self-reported version number.
Solution	Upgrade to BIND 9.11.22, 9.16.6, 9.17.4 or later.
Risk Factor	Medium
CVSS v2.0 Base Score	40

Synopsis The SSL certificate for this service cannot be trusted.

Description	The server's X.509 certificate cannot be trusted. This situation can occur in three different ways, in which the chain of trust can be broken, as stated below : - First, the top of the certificate chain sent by the server might not be descended from a known public certificate authority. This can occur either when the top of the chain is an unrecognized, self-signed certificate, or when intermediate certificates are missing that would connect the top of the certificate chain to a known public certificate authority. - Second, the certificate chain may contain a certificate that is not valid at the time of the scan. This can occur either when the scan occurs before one of the certificate's 'notBefore' dates, or after one of the certificate's 'notAfter' dates. - Third, the certificate chain may contain a signature that either didn't match the certificate's information or could not be verified. Bad signatures can be fixed by getting the certificate with the bad signature to be re-signed by its issuer. Signatures that could not be verified are the result of the certificate's issuer using a signing algorithm that Nessus either does not support or does not recognize. If the remote host is a public host in production, any break in the chain makes it more difficult for users to verify the authenticity and identity of the web server. This could make it easier to carry out man-in-the-middle attacks against the remote host.
Solution	Purchase or generate a proper SSL certificate for this service.

Synopsis	The remote host may be affected by a vulnerability that allows a remote attacker to potentially decrypt captured TLS traffic.
Description	The remote host supports SSLv2 and therefore may be affected by a vulnerability that allows a cross-protocol Bleichenbacher padding oracle attack known as DROWN (Decrypting RSA with Obsolete and Weakened eNcryption). This vulnerability exists due to a flaw in the Secure Sockets Layer Version 2 (SSLv2) implementation, and it allows captured TLS traffic to be decrypted. A man-in-the-middle attacker can exploit this to decrypt the TLS connection by utilizing previously captured traffic and weak cryptography along with a series of specially crafted connections to an SSLv2 server that uses the same private key.
Solution	Disable SSLv2 and export grade cryptography cipher suites. Ensure that private keys are not used anywhere with server software that supports SSLv2 connections.
Risk Factor	Medium

Protocol	tcp
Synopsis	The remote service supports the use of the RC4 cipher.
Description	The remote host supports the use of RC4 in one or more cipher suites. The RC4 cipher is flawed in its generation of a pseudo-random stream of bytes so that a wide

variety of small biases are introduced into the stream, decreasing its randomness. If plaintext is repeatedly encrypted (e.g., HTTP cookies), and an attacker is able to obtain many (i.e., tens of millions) ciphertexts, the attacker may be able to derive the plaintext.

Solution Reconfigure the affected application, if possible, to avoid use of RC4 ciphers. Consider using TLS 1.2 with AES-GCM suites subject to browser and web server support.

Name	HTTP TRACE / TRACK Methods Allowed
Plugin ID	58751
Port	25
Protocol	tcp
Synopsis	It may be possible to obtain sensitive information from the remotehost with SSL/TLS-enabled services.
Description	A vulnerability exists in SSL 3.0 and TLS 1.0 that could allow information disclosure if an attacker intercepts encrypted traffic served from an affected system. TLS 1.1, TLS 1.2, and all cipher suites that do not use CBC mode are not affected. This plugin tries to establish an SSL/TLS remote connection using an affected SSL version and cipher suite and then solicits return data. If returned application data is not fragmented with an empty or one-byte record, it is likely vulnerable. OpenSSL uses empty fragments as a countermeasure unless the 'SSL_OP_DONT_INSERT_EMPTY_FRAGMENTS' option is specified when OpenSSL is initialized. Microsoft implemented one-byte fragments as a countermeasure, and this setting can be controlled via the registry key HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\SecurityProviders\SCHANNEL\SendExtraRecord. Therefore, if multiple applications use the same SSL/TLS implementation, some may be vulnerable while others may not be, depending on whether or not a countermeasure has been enabled. Note that this plugin detects the vulnerability in the SSLv3/TLSv1 protocol implemented in the server. It does not detect the BEAST attack where it exploits the vulnerability at HTTPS client-side (i.e., Internet browser). The detection at server-side does not necessarily mean your server is vulnerable to the BEAST attack, because the attack exploits the vulnerability at the client-side, and both SSL/TLS clients and servers can independently employ the split record countermeasure.
Solution	Configure SSL/TLS servers to only use TLS 1.1 or TLS 1.2 if supported. Configure SSL/TLS servers to only support cipher suites that do not use block ciphers. Apply patches if available. Note that additional configuration may be required after the installation of the MS12-006 security update in order to enable the split-record countermeasure. See Microsoft KB2643584 for details.

Synopsis The remote Telnet server transmits traffic in cleartext.

Description The remote host is running a Telnet server over an unencrypted channel. Using Telnet over an unencrypted channel is not recommended as logins, passwords, and commands are transferred in cleartext. This allows a remote, man-in-the-middle attacker to eavesdrop on a Telnet session to obtain credentials or other sensitive information and to modify traffic exchanged between a client and server. SSH is preferred over Telnet since it protects credentials from eavesdropping and can tunnel additional data streams such as an X11 session.

Solution Disable the Telnet service and use SSH instead.

CVSS v2.0 Base Score	50

Name	HTTP TRACE / TRACK Methods Allowed
Plugin ID	85582
Port	80
Protocol	tcp
Synopsis	The remote web server may fail to mitigate a class of web application vulnerabilities.
Description	The remote web server does not set an X-Frame-Options response header or a Content-Security-Policy 'frame-ancestors' response header in all content responses. This could potentially expose the site to a clickjacking or UI redress attack, in which an attacker can trick a user into clicking an area of the vulnerable page that is different than what the user perceives the page to be. This can result in a user performing fraudulent or malicious transactions. X-Frame-Options has been proposed by Microsoft as a way to mitigate clickjacking attacks and is currently supported by all major browser vendors. Content-Security-Policy (CSP) has been proposed by the W3C Web Application Security Working Group, with increasing support among all major browser vendors, as a way to mitigate clickjacking and other attacks. The 'frame-ancestors' policy directive restricts which sources can embed the protected resource. Note that while the X-Frame-Options and Content-Security-Policy response headers are not the only mitigations for clickjacking, they are currently the most reliable methods that can be detected through automation. Therefore, this plugin may produce false positives if other mitigation strategies (e.g., frame-busting JavaScript) are deployed or if the page does not perform any security-sensitive transactions.
Solution	Return the X-Frame-Options or Content-Security-Policy (with the 'frame-ancestors' directive) HTTP header with the page's response. This prevents the page's content from being rendered by another site when using the frame or iframe HTML tags.

Synopsis	The 'autocomplete' attribute is not disabled on password fields.
Description	The remote web server contains at least one HTML form field that has an input of type 'password' where 'autocomplete' is not set to 'off'. While this does not represent a risk to this web server per se, it does mean that users who use the affected forms may have their credentials saved in their browsers, which could in turn lead to a loss of confidentiality if any of them use a shared host or if their machine is compromised at some point.
Solution	Add the attribute 'autocomplete=off' to these fields to prevent browsers from caching credentials.

SSH Server CBC Mode Ciphers Enabled	
Name	SSH Server CBC Mode Ciphers Enabled
Plugin ID	70658
Port	22
Protocol	tcp
Synopsis	The SSH server is configured to use Cipher Block Chaining.
Description	The SSH server is configured to support Cipher Block Chaining (CBC) encryption. This may allow an attacker to recover the plaintext message from the ciphertext. Note that this plugin only checks for the options of the SSH server and does not check for vulnerable software versions.
Solution	Contact the vendor or consult product documentation to disable CBC mode cipher encryption, and enable CTR or GCM cipher mode encryption.
Risk Factor	Low
CVSS v2.0 Base Score	26

SSH Weak MAC Algorithms Enabled	
Name	SSH Weak MAC Algorithms Enabled
Plugin ID	71049
Port	22
Protocol	tcp
Synopsis	The remote SSH server is configured to allow MD5 and 96-bit MAC algorithms.
Description	The remote SSH server is configured to allow either MD5 or 96-bit MAC algorithms, both of which are considered weak. Note that this plugin only checks for the options of the SSH server, and it does not check for vulnerable software versions.
Solution	Contact the vendor or consult product documentation to disable MD5 and 96-bit MAC algorithms.
Risk Factor	Low

SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)	
Name	SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)
Plugin ID	78479
Port	25
Protocol	tcp
Synopsis	It is possible to obtain sensitive information from the remote host with SSL/TLS-enabled services.

Description	The remote host is affected by a man-in-the-middle (MitM) information disclosure vulnerability known as POODLE. The vulnerability is due to the way SSL 3.0 handles padding bytes when decrypting messages encrypted using block ciphers in cipher block chaining (CBC) mode. MitM attackers can decrypt a selected byte of a cipher text in as few as 256 tries if they are able to force a victim application to repeatedly send the same data over newly created SSL 3.0 connections. As long as a client and service both support SSLv3, a connection can be 'rolled back' to SSLv3, even if TLSv1 or newer is supported by the client and service. The TLS Fallback SCSV mechanism prevents 'version rollback' attacks without impacting legacy clients; however, it can only protect connections when the client and service support the mechanism. Sites that cannot disable SSLv3 immediately should enable this mechanism. This is a vulnerability in the SSLv3 specification, not in any particular SSL implementation. Disabling SSLv3 is the only way to completely mitigate the vulnerability.
Solution	Disable SSLv3. Services that must support SSLv3 should enable the TLS Fallback SCSV mechanism until SSLv3 can be disabled.
Risk Factor	Medium
CVSS v2.0 Base Score	43

SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)	
Name	SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)
Plugin ID	78479
Port	5432
Protocol	tcp

Name	SSL/TLS EXPORT_DHE <= 512-bit Export Cipher Suites Supported (Logjam)
Plugin ID	83738
Port	25
Protocol	tcp
Synopsis	The remote host supports a set of weak ciphers.
Description	The remote host supports EXPORT_DHE cipher suites with keys less than or equal to 512 bits. Through cryptanalysis, a third party can find the shared secret in a short amount of time. A man-in-the-middle attacker may be able to downgrade the session to use EXPORT_DHE cipher suites. Thus, it is recommended to remove support for weak cipher suites.
Solution	Reconfigure the service to remove support for EXPORT_DHE cipher suites.
Risk Factor	Low
CVSS v2.0 Base Score	26

Name	SSL/TLS Diffie-Hellman Modulus <= 1024 Bits (Logjam)
Plugin ID	83875
Port	25
Protocol	tcp
Synopsis	The remote host allows SSL/TLS connections with one or more Diffie-Hellman moduli less than or equal to 1024 bits.
Description	The remote host allows SSL/TLS connections with one or more Diffie-Hellman moduli less than or equal to 1024 bits. Through cryptanalysis, a third party may be able to find the shared secret in a short amount of time (depending on modulus size and attacker resources). This may allow an attacker to recover the plaintext or potentially violate the integrity of connections.
Solution	Reconfigure the service to use a unique Diffie-Hellman moduli of 2048 bits or greater.
Risk Factor	Low
CVSS v2.0 Base Score	26

Name	SSH Weak Key Exchange Algorithms Enabled
Plugin ID	153953
Port	22
Protocol	tcp
Synopsis	The remote SSH server is configured to allow weak key exchange algorithms.
Description	The remote SSH server is configured to allow key exchange algorithms which are considered weak. This is based on the IETF draft document Key Exchange (KEX) Method Updates and Recommendations for Secure Shell (SSH) draft-ietf-curdle-ssh-kex-sha2-20. Section 4 lists guidance on key exchange algorithms that SHOULD NOT and MUST NOT be enabled. This includes: diffie-hellman-group-exchange-sha1 diffie-hellman-group1-sha1 gss-gex-sha1-* gss-group1-sha1-* gss-group14-sha1-* rsa1024-sha1 Note that this plugin only checks for the options of the SSH server, and it does not check for vulnerable software versions.
Solution	Contact the vendor or consult product documentation to disable the weak algorithms.
